A Experimental Instructions and Comprehension Questions: Main Treatment

This section reproduces the instructions and comprehension questions shown to participants in the main treatment and in the two control treatments. Screenshots are organized by experimental part.

A.1 Part 1 instructions

Instructions

- Welcome to this experiment!
- Please remain silent during the experiment and do not speak to other participants. If you have any question or need assistance of any kind, please raise your hand, and an experimenter will come to you.
- During this experiment, you will make a series of decisions. If you follow the instructions carefully, you can earn a considerable amount of money. How much money you earn will depend on your decisions, those made by other participants, and on chance.
- All payoffs in the experiment are expressed in “Points.” At the end of the experiment, your final earnings in Points will be converted into Euros at the rate indicated below. The money you earn will be paid to you in cash at the end of the experiment.
- The experiment will consist of four parts, called Part I, Part II, Part III and Part IV. We will first explain Part I. The other parts will be explained after the completion of Part I. After Part IV, you will be asked to answer a series of additional questions.
- Note that before each Part of the experiment begins, we will check your understanding of the relevant rules described in the instructions.

Next Page

Instructions for Part I

- In Part I you will make decisions in 10 independent rounds of the decision task described below.

The decision task

- In each round, you will be matched with another participant with whom you will interact.
- In the interaction, you and the other participant each chooses between two options, A and B. Choices are made simultaneously, that is, you do not know the choice of the other when making your choice and the other does not know your choice when making her choice.
- Your choice (A or B) and the other's choice (A or B) together determine the payoff you and the other will receive. The possible payoffs are shown in the following table:

		Other's choice			
		A		B	
Your choice	A	Y 0	0	0	O
	B	0 200	200	200	0

- The first entry in each cell of the payoff table represents your payoff.
- The second entry represents the payoff of the other participant you are matched with in an interaction.
- The payoffs "**Y**" (short for **Y**ou) and "**O**" (short for **O**ther) in the payoff table will be explained below.
- After you and the other have made your choices simultaneously and independently, you will learn the choices and your payoff.
- Payoffs in an interaction (see table above) are determined as follows:
 - If you choose A and the other chooses A, then you earn **Y** Points and the other earns 0 Points.
 - If you choose A and the other chooses B, then you earn 0 Points and the other earns **O** Points.
 - If you choose B and the other chooses A, then you earn 0 Points and the other earns 200 Points.
 - If you choose B and the other chooses B, then you earn 200 Points and the other earns 0 Points.

The payoffs **Y** and **O**

- In the example above, you will receive a payoff of **Y** in case you choose A, and the other chooses A too. Similarly, the other receives a payoff of **O** in case you choose A and the other chooses B.
- The numbers **Y** and **O** will be randomly and independently determined for you and the other at the beginning of each interaction. This is done by the computer, which will independently generate a random number **Y** for you and a random number **O** for the other. These random numbers will be one of the following 11 numbers: 200, 220, 240, ..., and 400. Each of these 11 numbers is equally likely to be drawn. The number **Y** drawn for you is independent of the number **O** drawn for the other.
- You will only be informed about the random number **Y** that was drawn for you. You will NOT be informed about the random number **O** that was drawn for the other. You only know that the number **O** of the other is between 200 and 400 and that each of these 11 possible numbers is drawn with an equal chance.

[Back](#)[Next Page](#)

Decision Screen

Below you see a screenshot of the decision screen in which you will make decisions in Part I of the experiment. It consists of a "Payoff table box," your "Decision-making box," the "Other's random payoff box," and an "Info box."

Decision: Round 1

Info box

Payoff table box

Payoff table:

		Other's choice	
		A	B
Your choice	A	0	340
	B	200	0

Decision-making box

Please make your choice by clicking A or B.

		200	220	240	260	280	300	320	340	360	380	400
Your choice	A	☐	☐	☐	☐	☐	☐	☐	☒	☐	☐	☐
	B	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐

Other's payoff box

The other participants' random value of ??? is drawn from the following numbers:

200	220	240	260	280	300	320	340	360	380	400
-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----

Events during a round

Computer randomly draws Y and O

Make your choice

Retrieving the other's choice

Determining payoffs you and other receive from this interaction

Show instructions

Confirm choice

- What you will know about your random number **Y** and the other's random number **O**, is summarized on screen when you make your decision.
- The "Decision-making box" shows all of your possible random numbers **Y**. At the beginning of a round, the computer will randomly draw a number **Y** for you and will randomly draw a number **O** for the other.
- Your randomly drawn number **Y** for a round will be indicated by a blue arrow and will also be displayed in the payoff table. You will not learn the random number **O** that was drawn for the other. This is indicated by the red question marks "???" in the payoff table.
- The "Other's payoff box" at the bottom of the decision-making screen shows the possible numbers that the random number **O** of the other participant was drawn from. But you will not learn which random number **O** was randomly drawn for the other.
- After you learned your **Y** and the other learned her **O**, each of you chooses A or B, independently from another and at the same time. You choose either option A or B, right below your highlighted payoff in the decision-making box. Click the "Confirm choice" button on the right of the screen to proceed.
- Your choice and the other's choice determine your and the other's payoff from the interaction as shown in the payoff table.
- The "Info box" on the right of the screen summarizes the course of events in a round.

Back

Next Page

Feedback Screen

- After you and the other made your choices, you will receive feedback, as shown in the screenshot below.
- The "Feedback table" summarizes your realized value for **Y**, your choice, the choice of the other, and your payoff. Note that you will not be informed about the value of **O** of the other.

Feedback: Round 1

Feedback table

Y	Your choice	Other's choice	Your payoff
340	A	B	340

		Other's choice	
		A	B
Your choice	A	0	340
	B	200	0

		Your possible values of Y										
		200	220	240	260	280	300	320	340	360	380	400
Your choice	A	☐	☐	☐	☐	☐	☐	☐	☒	☐	☐	☐
	B	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐

The other participants' random value of **???** is drawn from the following numbers:

 200
  220
  240
  260
  280
  300
  320
  340
  360

How participants are matched

- At the beginning of Part I, the computer will randomly determine groups of six participants each. The composition of these groups will remain the same in Part I. The identity of participants in your group and in any other group will not be revealed to you or any other participant.
- The computer will then randomly assign your group to one of the other groups. This assignment will remain fixed in Part I.
- In each of the 10 rounds, each member of your group of six will be randomly matched to one of the six members of the other group to make decisions as described above. Similarly, each of the members of the other group you are assigned to will be randomly matched with one of the members of your group.

How your earnings are determined

Your earnings from Part I of the experiment will be determined as follows:

- From the 10 rounds of the decision task you participate in, the computer will randomly select one round at the end of the experiment. The Points you earned in this round will be your earnings from Part I. All Points will be converted into Euros at an exchange rate of 100 Points = 1 Euro.

[Back](#)[Next Page](#)

Before the start of Part I of the experiment, let us summarize:

- Part I of the experiment consists of 10 rounds.
- In each round you will make a choice in the decision task.
- In each of the 10 rounds of Part I, each member of your group of six will be randomly matched to one of the six members of the same other group to make decisions as described above.
- When you are done reading the instructions, please start the quiz to check your understanding of the rules of Part I of the experiment.

[Back](#)[Start the quiz!](#)

A.2 Part 1 comprehension questions

Question 1

		Other's choice			
		A		B	
Your choice	A	Y	0	0	O
	B	0	200	200	0

- In the payoff table above, if you choose A and the other participant chooses B:
- ☐ your payoff is 0 Points and the payoff of the other participant is 200 Points.
 - ☐ your payoff is Y Points and the payoff of the other participant is 0 Points.
 - ☐ your payoff is 0 Points and the payoff of the other participant is O Points.
 - ☐ your payoff is Y Points and the payoff of the other participant is O Points.
 - ☐ your payoff is 200 Points and the payoff of the other participant is 0 Points.

If you have a question,
please use the
instructions below or
raise your hand.

Show instructions

Check answer

		Other's choice			
		A		B	
Your choice	A	Y	0	0	O
	B	0	200	200	0

In the payoff table above, if you choose A and the other participant chooses B:

- ☐ your payoff is 0 Points and the payoff of the other participant is 200 Points.
- ☐ your payoff is Y Points and the payoff of the other participant is 0 Points.
- ☐ your payoff is 0 Points and the payoff of the other participant is O Points.
- ☐ your payoff is Y Points and the payoff of the other participant is O Points.
- ☐ your payoff is 200 Points and the payoff of the other participant is 0 Points.

When you make your choice, do you know which choice the other participant has made?

- ☐ No, I do not know because the other participant chooses while I do.
- ☐ Yes, I do know because the other participant chooses before I do.
- ☐ I can not know from reading the instructions.

In each round, you will be:

- ☐ matched with any participant in the room.
- ☐ matched randomly with one of the six in in your matched group.
- ☐ matched with the same other participant.

In each round in this part, your random payoff **Y**:

- ☐ can be any number.
- ☐ will be one of the 11 numbers 200, 220, 240, ..., and 400.
- ☐ will always be the same as the random payoff **O** of the other.

When making a choice in the Decision Task:

- ☐ only you will know the number that has been drawn randomly as your payoff **Y**.
- ☐ you and the other will know the number that has been drawn as your payoff **Y**.
- ☐ you will not know the number that has been drawn randomly as your payoff **Y**.

When making a choice in the Decision Task:

- ☐ you will not know the number that has been drawn randomly as the other's payoff **O**.
- ☐ you will know the number that has been drawn randomly as the other's payoff **O**.
- ☐ neither the other nor you will know the number that has been drawn randomly as the other's payoff **O**.

Consider the following example: Suppose that in a round your random payoff **Y** was drawn to be 340. Then:

- ☐ the other's payoff **O** can NOT be 340.
- ☐ the other's payoff **O** can be any of the 11 numbers 200, 220, 240, ..., and 400.
- ☐ the other's payoff **O** is also 340.
- ☐ the other's payoff **O** is 260.

A.3 Part 1 decision and feedback

Feedback: Round 1

Y	Your choice	Other's choice	Your payoff
300	A	B	0

		Other's choice			
		A	B	A	B
Your choice	A	300	0	0	200
	B	0	???	200	0

		200	220	240	260	280	300	320	340	360	380	400
Your choice	A	☐	☐	☐	☐	☐	☒	☐	☐	☐	☐	☐
	B	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐

The other participants' random value of ??? is drawn from the following numbers:

200	220	240	260	280	300	320	340	360	380	400
-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----

A.4 Part 2 instructions

Instructions for Part II

- Part II consists of a decision task similar to the one in Part I, but there are some changes which we describe next.
- You will make decisions in 15 independent rounds.
- Recall that in Part I, you were first informed about your randomly drawn number **Y**, and then you made a choice.
- **In Part II, you will choose A or B for each of your 11 possible values of Y (200, 220, 240, ..., and 400) before Y will be drawn for you.**

That is, you will make 11 contingent if-then decisions of the form: "If **Y** is 200, then I will choose A or B.", "If **Y** is 220, then I will choose A or B.", and so on.

- When you are matched with another participant in an interaction, the computer will first randomly draw one of the 11 possible numbers for **Y**. Then, the computer will automatically implement the choice (A or B) you made for your drawn **Y**.
- Note that the computer will do the same for the other participant with whom you are matched in an interaction. The computer will first randomly draw a number **O** for the other and will then automatically implement the choice (A or B) the other made for this number **O**.

Next Page

Decision Screen

- The decision screen shown in the screenshot below is the same as the one used in Part I, with one exception:
- At the beginning of each round, you make contingent decisions in the "decision-making box:" You choose A or B for each of the possible values of **Y**. That is, you will choose either A or B, **for each of the 11 possible payoffs 200, 220, 240, ..., and 400.**
- As of round 2, the 11 contingent decisions you specified in the previous round will be shown in the decision-making box. **You are then free to keep or change any of the 11 contingent choices.**

Decision: Round 1

Payoff table:

		Other's choice	
		A	B
Your choice	A	0	Y
	B	200	0

Events during a round

200	220	240	260	280	300	320	340	360	380	400	

Back

Next Page

How your payoffs are determined in an interaction

- First, each participant chooses A or B for each of the 11 possible values of **Y**. These contingent decisions cannot be changed in a round after you have confirmed them.
- Then, you will be randomly and sequentially matched with each member of the other group. The six different interactions are called "Interaction 1" to "Interaction 6". The computer makes sure that you will interact with each member of the other group exactly once.
- **In each of the 6 interactions of a round**, the computer will independently generate a random number **Y** for you and a random number **O** for the other. Each of the 11 possible numbers 200, 220, 240, ..., and 400 is equally likely to be drawn. The randomly drawn number **Y** is independent of the randomly drawn number **O** for the other. The drawn numbers are also independent of those drawn in any other interaction or round.
- In each interaction, the computer will then look up the choice (A or B) you made for the drawn number **Y** and the choice (A or B) the other made for her drawn number **O**. These choices are then implemented by the computer and determine your and the other's payoffs for a given interaction according to the same payoff table as in Part I:

		Other's choice			
		A		B	
Your choice	A	Y 0		0	O
	B	0 200		200 0	

Back

Next Page

Feedback Screen

- After the outcomes of the six interactions in a round have been determined, you will receive feedback.
- In round 1, feedback for each of the six interactions will be shown sequentially.
- In all later rounds, feedback for each of the interactions (Interaction 1, 2, 3, 4, 5, and 6) in a round is given in a "Summary feedback table," see screenshot below. The table summarizes, for each interaction in a separate row, your drawn **Y**, your choice, the choice of the other and your payoff.
- Note that when you hover the mouse over a row in the feedback table the corresponding information will be highlighted in light blue in the payoff table. Additionally, note that you can order the rows of the feedback table according to the size of the randomly drawn number **Y**. You can do so by clicking on the little icon "T↓" in the column labelled **Y**.

Summary feedback table

Feedback: Round 1

Interaction	T↓	Y	T↓	Your choice	Other's choice	Your payoff
1		320		B	B	0
2		320		B	B	0

The other participants' random values of ??? were drawn from the following numbers:

200	220	240	260	280	300	320	340	360	380	400
-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----

Show instructions: Part I

Show instructions: Part II

Continue

How your earnings are determined

Your earnings from Part II will be determined as follows:

- From the 15 rounds of the decision task in Part II, the computer will randomly select one round at the end of the experiment. Because you participate in six interactions in each round, the sum of Points you earned in these six interactions will be your earnings from Part II. Again, Points will be converted into Euros at an exchange rate of 100 Points = 1 Euro.

Back

Next Page

Before the start of Part II of the experiment, let us summarize:

- Part II of the experiment consists of 15 rounds.
- In each round, you will make contingent choices (A or B) for each of your 11 possible random payoffs 200, 220, 240, ..., and 400.
- After you have made these choices, in each of the 15 rounds, you will be randomly and sequentially matched with each of the six members of the same other group.
- In each of these six independent interactions, the computer will automatically implement the contingent choice you made, conditional on your drawn number **Y**. This number **Y** is drawn randomly in each interaction. Together with the contingent choice of the other (which depends on the other's randomly drawn number **O**) the payoffs for you and the other in an interaction are determined.
- In each of the six interactions, the numbers **Y** and **O** are drawn independently from each other.
- When you are done reading the instructions, please start the quiz to check your understanding of the rules of Part II of the experiment.

Back

Start the quiz!

A.5 Part 2 comprehension questions

In Part II, you will specify in each round:

- ☐ 11 contingent decisions, by making a choice A or B for each possible random value of **Y** (that is for 200, 220, 240, ..., and 400).
- ☐ only one choice A or B.
- ☐ 6 choices, for each interaction one.

In Part II, you will participate in each round:

- ☐ in 11 interactions, for each possible random value of **Y** (that is for 200, 220, 240, ..., and 400) once.
- ☐ in 1 interaction with one other participant.
- ☐ in 6 interactions, and in each interaction you will be matched with one of the six others from the other group.

In a round in Part II:

- ☐ your number **Y** will be randomly drawn for each interaction independently. Then, you make the choice (A or B) without learning **Y**.
- ☐ your number **Y** will be randomly drawn for each interaction independently. Then, you make the choice (A or B) for this payoff **Y**.
- ☐ your number **Y** will be randomly drawn for each interaction independently. Then, the choice you specified for this payoff **Y** will be automatically implemented by the computer for you.

In each interaction in a round in Part II:

- ☐ your random payoff **Y** and the random payoff **O** of the other in an interaction are drawn independently by the computer.
- ☐ your random payoff **Y** and the random payoff **O** of the other in an interaction are never the same.
- ☐ your random payoff **Y** and the random payoff **O** of the other in an interaction are the same.

Which of the following draws of **Y** for the 6 interactions in a round is possible:

- ☐ 200, 220, 280, 300, 390, 400
- ☐ 380, 220, 300, 180, 280, 200
- ☐ 340, 320, 340, 400, 200, 340
- ☐ 334, 342, 257, 320, 338, 252

A.7 Part 3 instructions

Instructions for Part III

- Part III consists of a decision task similar to the one in Part II, but there is one change which we describe below.
- You will again make decisions in 15 independent rounds.
- Recall that in each round of Part II, you made a decision for each of 11 possible values of **Y** before a value for **Y** was drawn for you.
- As in Part II, the numbers **Y** and **O** will be randomly and independently determined for you and the other at the beginning of each interaction. This is done by the computer, which will independently generate a random number **Y** for you and a random number **O** for the other. Each of these 11 numbers is equally likely to be drawn. The number **Y** drawn for you is independent of the number **O** drawn for the other. **However, unlike in Part II, these random numbers will be one of the following 11 numbers: 250, 260, 270, ..., and 350.**
- That is, you will make 11 contingent if-then decisions of the form: "If **Y** is 250, then I will choose A or B.", "If **Y** is 260, then I will choose A or B.", and so on.
- When you are matched with another participant in an interaction, the computer will first randomly draw one of the 11 possible numbers for **Y**. Then, the computer will automatically implement the choice (A or B) you made for your drawn **Y**.
- Note that the computer will do the same for the other participant with whom you are matched in an interaction. The computer will first randomly draw a number **O** for the other and will then automatically implement the choice (A or B) the other made for this number **O**.

Next Page

How participants are matched

- The group compositions and the groups to which you and other participants belong remain the same as in Part II.
- In each round, you will be randomly and sequentially matched with each of the six others of the other group. You will receive a payoff for each of the six interactions in a round.

How your payoffs are determined in an interaction

- First, each participant chooses A or B for each of the 11 possible values of **Y**. These contingent decisions cannot be changed in a round after you have confirmed them.
- Then, you will be randomly and sequentially matched with each member of the other group. The six different interactions are called "Interaction 1" to "Interaction 6". The computer makes sure that you will interact with each member of the other group exactly once.
- **In each of the 6 interactions of a round**, the computer will independently generate a random number **Y** for you and a random number **O** for the other. Each of the 11 possible numbers 250, 260, 270, ..., and 350 is equally likely to be drawn. The randomly drawn number **Y** is independent of the randomly drawn number **O** for the other. The drawn numbers are also independent of those drawn in any other interaction or round.
- In each interaction, the computer will then look up the choice (A or B) you made for the drawn number **Y** and the choice (A or B) the other made for her drawn number **O**. These choices are then implemented by the computer and determine your and the other's payoffs for a given interaction according to the same payoff table as in Part I:

		Other's choice	
		A	B
Your choice	A	Y 0	0 O
	B	0 200	200 0

How your earnings are determined

Your earnings from Part III will be determined as follows:

- From the 15 rounds of the decision task in Part III, the computer will randomly select one round at the end of the experiment. Because you participate in six interactions in each round, the sum of Points you earned in these six interactions will be your earnings from Part III. Again, Points will be converted into Euros at an exchange rate of 100 Points = 1 Euro.

[Back](#)[Next Page](#)

Before the start of Part III of the experiment, let us summarize:

- Part III of the experiment consists of 15 rounds.
- In each round, you will make contingent choices (A or B) for each of your 11 possible random payoffs 250, 260, 270, ..., and 350.
- After you have made these choices, in each of the 15 rounds, you will be randomly and sequentially matched with each of the six members of the same other group.
- In each of these six independent interactions, the computer will automatically implement the contingent choice you made, conditional on your drawn number **Y**. This number **Y** is drawn randomly in each interaction. Together with the contingent choice of the other (which depends on the other's randomly drawn number **O**) the payoffs for you and the other in an interaction are determined.
- In each of the six interactions, the numbers **Y** and **O** are drawn independently from each other.
- When you are done reading the instructions, please start the quiz to check your understanding of the rules of Part III of the experiment.

Back

Start the quiz!

A.8 Part 3 control questions

In Part III, your random value of **Y** will be drawn from the following numbers:

- ☐ any number between 200 and 400
- ☐ 200, 220, 240, 260, 280, 300, 320, 340, 360, 380, and 400
- ☐ any number between 250 and 350
- ☐ 250, 260, 270, 280, 290, 300, 310, 320, 330, 340, and 350

In Part III, the other's random value of **O** will be drawn from the following numbers:

- ☐ any number between 200 and 400
- ☐ 200, 220, 240, 260, 280, 300, 320, 340, 360, 380, and 400
- ☐ 250, 260, 270, 280, 290, 300, 310, 320, 330, 340, and 350
- ☐ any number between 250 and 350

In a round in Part III:

- ☐ your number **Y** will be randomly drawn for each interaction independently. Then, you make the choice (A or B) without learning **Y**.
- ☐ your number **Y** will be randomly drawn for each interaction independently. Then, the choice you specified for this payoff **Y** will be automatically implemented by the computer for you.
- ☐ your number **Y** will be randomly drawn for each interaction independently. Then, you make the choice (A or B) for this payoff **Y**.

In each interaction in a round in Part III:

- ☐ your random payoff **Y** and the random payoff **O** of the other in an interaction are never the same.
- ☐ your random payoff **Y** and the random payoff **O** of the other in an interaction are the same.
- ☐ your random payoff **Y** and the random payoff **O** of the other in an interaction are drawn independently by the computer.

A.9 Part 3 decision and feedback

As in Part 2 with different numbers.

A.10 Part 4 instructions

Instructions for Part IV

- Part IV consists of a decision task similar to the one in Part II and III, but there is one change which we describe below.
- You will again make decisions in 15 independent rounds.
- Recall that in Part II and III, you made a decision for each of 11 possible values of **Y** before a value for **Y** was drawn for you.
- In each round of Part IV, you will again make 11 decisions. However, now **Y** (and also **O** for the other) will always be 300.
- When you are matched with another participant in an interaction, the computer will first randomly draw one of the 11 if-then decisions. Then, the computer will automatically implement the choice (A or B) you made for the drawn if-then decision.
- Note that the computer will do the same for the other participant with whom you are matched in an interaction. The computer will first randomly draw one of the contingent if-then decisions of the other and will then automatically implement the choice (A or B) the other made for the drawn if-then decision.

Next Page

How participants are matched

- The group compositions and the groups to which you and other participants belong remain the same as in Part II and III.
- In each round, you will be randomly and sequentially matched with each of the six others of the other group. You will receive a payoff for each of the six interactions in a round.

How your payoffs are determined in an interaction

- First, each participant chooses A or B for each of the 11 if-then decisions. These decisions cannot be changed in a round after you have confirmed them.
- Then, you will be randomly and sequentially matched with each member of the other group. The six different interactions are called "Interaction 1" to "Interaction 6". The computer makes sure that you will interact with each member of the other group exactly once.
- In each of the 6 interactions of a round, the computer will independently draw one of the 11 if-then decisions for you and one of the 11 if-then decisions for the other. Each of the 11 if-then decisions is equally likely to be drawn. The randomly drawn if-then decision is independent of the randomly drawn if-then decision for the other. The drawn if-then decisions are also independent of those drawn in any other interaction or round.
- In each interaction, the computer will then look up the choice (A or B) you made for the drawn if-then decision and the choice (A or B) the other made for her drawn number if-then decision. These choices are then implemented by the computer and determine your and the other's payoffs for a given interaction according to the payoff table below:

		Other's choice			
		A		B	
Your choice	A	300	0	0	300
	B	0	200	200	0

How your earnings are determined

Your earnings from Part IV will be determined as follows:

- From the 15 rounds of the decision task in Part IV, the computer will randomly select one round at the end of the experiment. Because you participate in six interactions in each round, the sum of Points you earned in these six interactions will be your earnings from Part IV. Again, Points will be converted into Euros at an exchange rate of 100 Points = 1 Euro.

[Back](#)[Next Page](#)

Before the start of Part IV of the experiment, let us summarize:

- Part IV of the experiment consists of 15 rounds.
- In each round, you will make 11 if then decisions (A or B).
- After you have made these choices, in each of the 15 rounds, you will be randomly and sequentially matched with each of the six members of the same other group.
- In each of these six independent interactions, the computer will randomly draw one of the 11 if-then decisions and automatically implements the choice you made for the drawn decision. Similarly for the other. Together with the drawn if-then decision of the other, the payoffs for you and the other in an interaction are determined.
- When you are done reading the instructions, please start the quiz to check your understanding of the rules of Part IV of the experiment.

Back

Start the quiz!

A.11 Part 4 control questions

If the second if-then-decision from the left is chosen for me in the first round:

- ☐ the decision in the second position is chosen for the other player.
- ☐ any of the 11 possible choices can be chosen for the other player.
- ☐ the decision in the second-to-last position is chosen for the other player.

In a round in Part IV:

- ☐ each choice you made could be played more than once or not at all.
- ☐ each choice you made will be played at least once.
- ☐ each choice you made will be played exactly once.
- ☐ each choice you made will be played at most once.

A.12 Part 4 decision and feedback

Decision: Round 1

Payoff table:

		Other's choice	
		A	B
Your choice	A	0 ???	Y 0
	B	200 0	0 200

Please make your choice by clicking A or B for each of your possible random values of Y.

Your possible values of Y		300	300	300	300	300	300	300	300	300	300	300
Your choice	A	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐
	B	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐

The other participants' random values of ??? are drawn from the following numbers:

300	300	300	300	300	300	300	300	300	300	300	300

B Experimental Instructions and Comprehension Questions: Control Treatments

B.1 No perturbations (strategy method): Part 1

Instructions

- Welcome to this experiment!
- Please remain silent during the experiment and do not speak to other participants. If you have any question or need assistance of any kind, please raise your hand, and an experimenter will come to you.
- During this experiment, you will make a series of decisions. If you follow the instructions carefully, you can earn a considerable amount of money. How much money you earn will depend on your decisions, those made by other participants, and on chance.
- All payoffs in the experiment are expressed in “Points.” At the end of the experiment, your final earnings in Points will be converted into Euros at the rate indicated below. The money you earn will be paid to you in cash at the end of the experiment.
- The experiment will consist of four parts, called Part I, Part II, Part III and Part IV. We will first explain Part I. The other parts will be explained after the completion of Part I. After Part IV, you will be asked to answer a series of additional questions.
- Note that before some Parts of the experiment begin, we will check your understanding of the relevant rules described in the instructions.

Next Page

Instructions for Part I

- In Part I you will make decisions in 10 independent rounds of the decision task described below.

The decision task

- In each round, you will be matched with another participant with whom you will interact.
- In the interaction, you and the other participant each chooses between two options, A and B. Choices are made simultaneously, that is, you do not know the choice of the other when making your choice and the other does not know your choice when making her choice.
- Your choice (A or B) and the other's choice (A or B) together determine the payoff you and the other will receive. The possible payoffs are shown in the following table:

		Other's choice			
		A		B	
Your choice	A	300	0	0	300
	B	0	200	200	0

- The first entry in each cell of the payoff table represents your payoff.
- The second entry represents the payoff of the other participant you are matched with in an interaction.
- After you and the other have made your choices simultaneously and independently, you will learn the choices and your payoff.
- Payoffs in an interaction (see table above) are determined as follows:
 - If you choose A and the other chooses A, then you earn 300 Points and the other earns 0 Points.
 - If you choose A and the other chooses B, then you earn 0 Points and the other earns 300 Points.
 - If you choose B and the other chooses A, then you earn 0 Points and the other earns 200 Points.
 - If you choose B and the other chooses B, then you earn 200 Points and the other earns 0 Points.

Info box

What happens during a round

Computer randomly draws an event

Make your choice

Retrieving the other's choice

Determining payoffs you and other receive from this interaction

Show instructions

Confirm choice

- The "Decision-making box" shows 11 possible "events," labelled 1, 2, ..., 11. At the beginning of a round, the computer will randomly draw an event for you and will randomly draw an event for the other. Each of these 11 events is equally likely to be drawn. The event drawn for you is independent of the event drawn for the other.
- Your randomly drawn event for a round will be indicated by an arrow.
- After you learned your randomly drawn event and the other learned her event, each of you chooses A or B, independently from another and at the same time. You choose either option A or B, right below your highlighted event in the decision-making box. Click the "Confirm choice" button on the right of the screen to proceed.
- Your choice and the other's choice for the drawn events determine your and the other's payoff from the interaction as shown in the payoff table.
- The "Info box" on the right of the screen summarizes the course of events in a round.

Retrieving the other's choice

Determining payoffs you and other receive from this interaction

Show instructions

Continue

How participants are matched

- At the beginning of Part I, the computer will randomly determine groups of six participants each. The composition of these groups will remain the same in Part I. The identity of participants in your group and in any other group will not be revealed to you or any other participant.
- The computer will then randomly assign your group to one of the other groups. This assignment will remain fixed in Part I.
- In each of the 10 rounds, each member of your group of six will be randomly matched to one of the six members of the other group to make decisions as described above. Similarly, each of the members of the other group you are assigned to will be randomly matched with one of the members of your group.

How your earnings are determined

Your earnings from Part I of the experiment will be determined as follows:

- From the 10 rounds of the decision task you participate in, the computer will randomly select one round at the end of the experiment. The Points you earned in this round will be your earnings from Part I. All Points will be converted into Euros at an exchange rate of 100 Points = 1 Euro.

Back

Next Page

Before the start of Part I of the experiment, let us summarize:

- Part I of the experiment consists of 10 rounds.
- In each round you will make a choice in the decision task.
- In each of the 10 rounds of Part I, each member of your group of six will be randomly matched to one of the six members of the same other group to make decisions as described above.
- When you are done reading the instructions, please start the quiz to check your understanding of the rules of Part I of the experiment.

Back

Start the quiz!

		Other's choice			
		A		B	
Your choice	A	300	0	0	300
	B	0	200	200	0

In the payoff table above, if you choose A and the other participant chooses B:

- ☐ your payoff is 200 Points and the payoff of the other participant is 0 Points.
- ☐ your payoff is 0 Points and the payoff of the other participant is 200 Points.
- ☐ your payoff is 0 Points and the payoff of the other participant is 300 Points.
- ☐ your payoff is 300 Points and the payoff of the other participant is 0 Points.
- ☐ your payoff is 300 Points and the payoff of the other participant is 300 Points.

When you make your choice, do you know which choice the other participant has made?

- ☐ No, I do not know because the other participant chooses while I do.
- ☐ I can not know from reading the instructions.
- ☐ Yes, I do know because the other participant chooses before I do.

In each round, you will be:

- ☐ matched randomly with one of the six in in your matched group.
- ☐ matched with any participant in the room.
- ☐ matched with the same other participant.

In each round in this part, the randomly selected event:

- ☐ will be always be the same.
- ☐ is chosen by you.
- ☐ will be one of the 11 possible events.

Consider the following example: Suppose that in a round your random event was drawn to be 8. Then:

- ☐ the other's event can NOT be 8.
- ☐ the other's event is 5.
- ☐ the other's event is also 8.
- ☐ the other's event can be any of the 11 events 1, 2, ..., and 11.

B.2 No perturbations (strategy method): Part 2

Instructions for Part II

- Part II consists of a decision task similar to the one in Part I, but there are some changes which we describe next.
- You will make decisions in 15 independent rounds.
- Recall that in Part I, you were first informed about your randomly drawn event and then you made a choice.
- **In Part II, you will choose A or B for each of the 11 possible events (1, 2, ..., and 11) before a particular event will be drawn for you.**
That is, you will make 11 contingent if-then decisions of the form: "If event 1, then I will choose A or B.", "If event 2, then I will choose A or B.", and so on.
- When you are matched with another participant in an interaction, the computer will first randomly draw one of the 11 possible events for you. Then, the computer will automatically implement the choice (A or B) you made for your drawn event.
- Note that the computer will do the same for the other participant with whom you are matched in an interaction. The computer will first randomly draw an event for the other and will then automatically implement the choice (A or B) the other made for this event.

Next Page

Decision Screen

- The decision screen shown in the screenshot below is the same as the one used in Part I, with one exception:
- At the beginning of each round, you make contingent decisions in the "decision-making box:" You choose A or B for each of the possible events. That is, you will choose either A or B, **for each of the 11 possible events 1, 2, ..., and 11.**
- As of round 2, the 11 contingent decisions you specified in the previous round will be shown in the decision-making box. **You are then free to keep or change any of the 11 contingent choices.**

How your payoffs are determined in an interaction

- First, each participant chooses A or B **for each of the 11 possible events**. These contingent decisions cannot be changed in a round after you have confirmed them.
- Then, you will be randomly and sequentially matched with each member of the other group. The six different interactions are called "Interaction 1" to "Interaction 6". The computer makes sure that you will interact with each member of the other group exactly once.
- **In each of the 6 interactions of a round**, the computer will independently select a random event for you and a random event for the other. Each of the 11 possible events 1, 2, ..., and 11 is equally likely to be drawn. The randomly drawn event for you is independent of the randomly drawn event for the other. The drawn events are also independent of those drawn in any other interaction or round.
- In each interaction, the computer will then look up the choice (A or B) you made for the drawn event and the choice (A or B) the other made for her drawn event. These choices are then implemented by the computer and determine your and the other's payoffs for a given interaction according to the same payoff table as in Part I:

		Other's choice			
		A		B	
Your choice	A	300	0	0	300
	B	0	200	200	0

[Back](#)[Next Page](#)

Feedback Screen

- After the outcomes of the six interactions in a round have been determined, you will receive feedback.
- In round 1, feedback for each of the six interactions will be shown sequentially.
- In all later rounds, feedback for each of the interactions (Interaction 1, 2, 3, 4, 5, and 6) in a round is given in a "Summary feedback table;" see screenshot below. The table summarizes, for each interaction in a separate row, your choice, the choice of the other and your payoff.
- Note that when you hover the mouse over a row in the feedback table the corresponding information will be highlighted in light blue in the payoff table.

How your earnings are determined

Your earnings from Part II will be determined as follows:

- From the 15 rounds of the decision task in Part II, the computer will randomly select one round at the end of the experiment. Because you participate in six interactions in each round, the sum of Points you earned in these six interactions will be your earnings from Part II. Again, Points will be converted into Euros at an exchange rate of 100 Points = 1 Euro.

Back

Next Page

Before the start of Part II of the experiment, let us summarize:

- Part II of the experiment consists of 15 rounds.
- In each round, you will make contingent choices (A or B) for each of 11 possible random events 1, 2, ..., and 11.
- After you have made these choices, in each of the 15 rounds, you will be randomly and sequentially matched with each of the six members of the same other group.
- In each of these six independent interactions, the computer will automatically implement the contingent choice you made, conditional on your drawn event. This event is drawn randomly in each interaction. Together with the contingent choice of the other (which depends on the other's randomly drawn event) the payoffs for you and the other in an interaction are determined.
- When you are done reading the instructions, please start the quiz to check your understanding of the rules of Part II of the experiment.

Back

Start the quiz!

In Part II, you will specify in each round:

- ☐ only one choice A or B.
- ☐ 11 contingent decisions, by making a choice A or B for each possible random event (that is for event 1, 2, ..., and 11).
- ☐ 6 choices, for each interaction one.

In Part II, you will participate in each round:

- ☐ in 1 interaction with one other participant.
- ☐ in 11 interactions, for each possible random event (that is for event 1, 2, ..., and 11) once.
- ☐ in 6 interactions, and in each interaction you will be matched with one of the six others from the other group.

In a round in Part II:

- ☐ your event will be randomly drawn for each interaction independently. Then, you make the choice (A or B) for this payoff event.
- ☐ your event will be randomly drawn for each interaction independently. Then, you make the choice (A or B) without knowing the event.
- ☐ your event will be randomly drawn for each interaction independently. Then, the choice you specified for this event will be automatically implemented by the computer for you.

In each interaction in a round in Part II:

- ☐ your random event and the random event of the other in an interaction are drawn independently by the computer.
- ☐ your random event and the random event of the other in an interaction are the same.
- ☐ your random event and the random event of the other in an interaction are never the same.

B.3 No perturbations (strategy method): Parts 3 and 4

Instructions for Part III

Part III consists of a decision task that is exactly the same as in Part II.

- Part III of the experiment consists of 15 rounds.
- In each round, you will make contingent choices (A or B) for each of your 11 possible random events 1, 2, ..., and 11.
- After you have made these choices in a round, you will be randomly and sequentially matched with each of the six members of the same other group.
- In each of these six independent interactions, the computer will automatically implement the contingent choice you made, conditional on your drawn event. An event is drawn randomly in each interaction. Together with the contingent choice of the other (which depends on the other's randomly drawn event) the payoffs for you and the other in an interaction are determined.
- In each of the six interactions, the events for you and the other are drawn independently from each other.
- The group compositions and the groups to which you and other participants belong remain the same as in Part II. In each round, you will be randomly and sequentially matched with each of the six others of the other group.
- From the 15 rounds of the decision task in Part III, the computer will randomly select one round at the end of the experiment. Because you participate in six interactions in each round, the sum of Points you earned in these six interactions will be your earnings from Part III. Again, Points will be converted into Euros at an exchange rate of 100 Points = 1 Euro.
- You can consult the detailed instruction of Part II anytime on the decision screen.

Start the next part!

Instructions for Part IV

Part IV consists of a decision task that is exactly the same as in Part II.

- Part IV of the experiment consists of 15 rounds.
- In each round, you will make contingent choices (A or B) for each of your 11 possible random events 1, 2, ..., and 11.
- After you have made these choices in a round, you will be randomly and sequentially matched with each of the six members of the same other group.
- In each of these six independent interactions, the computer will automatically implement the contingent choice you made, conditional on your drawn event. An event is drawn randomly in each interaction. Together with the contingent choice of the other (which depends on the other's randomly drawn event) the payoffs for you and the other in an interaction are determined.
- In each of the six interactions, the events for you and the other are drawn independently from each other.
- The group compositions and the groups to which you and other participants belong remain the same as in Part II. In each round, you will be randomly and sequentially matched with each of the six others of the other group.
- From the 15 rounds of the decision task in Part IV, the computer will randomly select one round at the end of the experiment. Because you participate in six interactions in each round, the sum of Points you earned in these six interactions will be your earnings from Part IV. Again, Points will be converted into Euros at an exchange rate of 100 Points = 1 Euro.
- You can consult the detailed instruction of Part II anytime on the decision screen.

Start the next part!

B.4 No perturbations (direct method)

Instructions

- Welcome to this experiment!
- Please remain silent during the experiment and do not speak to other participants. If you have any question or need assistance of any kind, please raise your hand, and an experimenter will come to you.
- During this experiment, you will make a series of decisions. If you follow the instructions carefully, you can earn a considerable amount of money. How much money you earn will depend on your decisions, those made by other participants, and on chance.
- All payoffs in the experiment are expressed in "Points." At the end of the experiment, your final earnings in Points will be converted into Euros at the rate indicated below. The money you earn will be paid to you in cash at the end of the experiment.
- The experiment will consist of four parts, called Part I, Part II, Part III and Part IV. We will first explain Part I. The other parts will be explained after the completion of Part I. After Part IV, you will be asked to answer a series of additional questions.
- Note that before some Parts of the experiment begin, we will check your understanding of the relevant rules described in the instructions.

Next Page

Instructions for Part I

- In Part I you will make decisions in 10 independent rounds of the decision task described below.

The decision task

- In each round, you will be matched with another participant with whom you will interact.
- In each round, you and the other participant each choose between two options, A and B. Choices are made simultaneously, that is, you do not know the choice of the other when making your choice and the other does not know your choice when making her choice.
- Your choice (A or B) and the other's choice (A or B) together determine the payoff you and the other will receive. The possible payoffs are shown in the following table:

		Other's choice			
		A		B	
Your choice	A	300	0	0	300
	B	0	200	200	0

- The first entry in each cell of the payoff table represents your payoff.
- The second entry represents the payoff of the other participant you are matched with in this round.
- After you and the other have made your choices simultaneously and independently, you will learn the choices and your payoff.
- Payoffs in a round (see table above) are determined as follows:
 - If you choose A and the other chooses A, then you earn 300 Points and the other earns 0 Points.
 - If you choose A and the other chooses B, then you earn 0 Points and the other earns 300 Points.
 - If you choose B and the other chooses A, then you earn 0 Points and the other earns 200 Points.
 - If you choose B and the other chooses B, then you earn 200 Points and the other earns 0 Points.

Decision Screen

Below you see a screenshot of the decision screen in which you will make decisions in Part I of the experiment. It consists of a "Payoff table box," your "Decision-making box," and an "Info box."

Payoff table box

Decision: Round 1 / 10

Payoff table:

		Other's choice			
		A		B	
Your choice	A	0	300	300	0
	B	200	0	0	200

Info box

Decision-making box

Please make your choice by clicking A or B:

☐ A

☐ B

Events during a round

Make your choice

Computer randomly matches you with another participant

Retrieving the other's choice

Determining payoffs you and other receive from this interaction

Show instructions: Part I

Confirm choice

- In every round, each of you chooses A or B, independently from another and at the same time. You choose either option A or B in the decision-making box. Click the "Confirm choice" button on the right of the screen to proceed.
- Your choice and the other's choice determine your and the other's payoff from the round as shown in the payoff table.
- The "Info box" on the right of the screen summarizes the course of events in a round.

How participants are matched

- At the beginning of Part I, the computer will randomly determine groups of six participants each. The composition of these groups will remain the same in Part I. The identity of participants in your group and in any other group will not be revealed to you or any other participant.
- The computer will then randomly assign your group to one of the other groups. This assignment will remain fixed in Part I.
- In each of the 10 rounds, each member of your group of six will be randomly matched to one of the six members of the other group to make decisions as described above. Similarly, each of the members of the other group you are assigned to will be randomly matched with one of the members of your group.

How your earnings are determined

Your earnings from Part I of the experiment will be determined as follows:

- From the 10 rounds of the decision task you participate in, the computer will randomly select one round at the end of the experiment. The Points you earned in this round will be your earnings from Part I. All Points will be converted into Euros at an exchange rate of 100 Points = 1 Euro.

[Back](#)[Next Page](#)

Before the start of Part I of the experiment, let us summarize:

- Part I of the experiment consists of 10 rounds.
- In each round you will make a choice in the decision task.
- In each of the 10 rounds of Part I, each member of your group of six will be randomly matched to one of the six members of the same other group to make decisions as described above.
- When you are done reading the instructions, please start the quiz to check your understanding of the rules of Part I of the experiment.

[Back](#)[Start the quiz!](#)

		Other's choice			
		A		B	
Your choice	A	300	0	0	300
	B	0	200	200	0

In the payoff table above, if you choose A and the other participant chooses B:

- ☐ your payoff is 300 Points and the payoff of the other participant is 0 Points.
- ☐ your payoff is 200 Points and the payoff of the other participant is 0 Points.
- ☐ your payoff is 0 Points and the payoff of the other participant is 200 Points.
- ☐ your payoff is 0 Points and the payoff of the other participant is 300 Points.
- ☐ your payoff is 300 Points and the payoff of the other participant is 300 Points.

When you make your choice, do you know which choice the other participant has made?

- ☐ I can not know from reading the instructions.
- ☐ No, I do not know because the other participant chooses while I do.
- ☐ Yes, I do know because the other participant chooses before I do.

In each round, you will be:

- ☐ matched randomly with one of the six in in your matched group.
- ☐ matched with any participant in the room.
- ☐ matched with the same other participant.

Instructions for Part II

Part II consists of a decision task similar to the one in Part I, but there are some changes.

- **Part II of the experiment consists of 60 rounds.**
- The group compositions and the groups to which you and other participants belong remain the same as in Part I. In each round, you will be randomly matched with a participant of the other group.
- In each round, each of you chooses A or B, independently from another and at the same time.
- Your choice and the other's choice determine your and the other's payoff from the round according to the same payoff table as in Part I.
- From the 60 rounds of the decision task in Part II, the computer will randomly select six rounds. The sum of Points you earned in these six rounds will be your earnings from Part II. Again, Points will be converted into Euros at an exchange rate of 100 Points = 1 Euro.

You can consult the detailed instructions of Part I anytime on the decision screen. But recall that Part II of the experiment consists, unlike Part I, of 60 rounds. The sum of Points you earned in six randomly selected rounds will be your earnings from this part.

Start the quiz!

Part II will consist of:

- ☐ 60 rounds of the decision task and 6 randomly selected rounds will be payoff relevant.
- ☐ 6 rounds of the decision task and 1 randomly selected round will be payoff relevant.
- ☐ 10 rounds of the decision task and 1 randomly selected round will be payoff relevant.

Instructions for Part III

Part III consists of a decision task that is exactly the same as in Part II. More precisely

- Part III of the experiment consists of 60 rounds.
- The group compositions and the groups to which you and other participants belong remain the same as in Part II. In each round, you will be randomly matched with a participant of the other group.
- In each round, each of you chooses A or B, independently from another and at the same time.
- Your choice and the other's choice determine your and the other's payoff from the round according to the same payoff table as in Part I.
- From the 60 rounds of the decision task in Part III, the computer will randomly select six rounds. The sum of Points you earned in these six rounds will be your earnings from Part III. Again, Points will be converted into Euros at an exchange rate of 100 Points = 1 Euro.

You can consult the detailed instructions of Part I anytime on the decision screen. But recall that Part III of the experiment consists, unlike Part I, of 60 rounds. The sum of Points you earned in six randomly selected rounds will be your earnings from this part.

Start the next part!

Instructions for Part IV

Part IV also consists of a decision task that is exactly the same as in Part II. More precisely

- Part IV of the experiment consists of 60 rounds.
- The group compositions and the groups to which you and other participants belong remain the same as in Part II and III. In each round, you will be randomly matched with a participant of the other group.
- In each round, each of you chooses A or B, independently from another and at the same time.
- Your choice and the other's choice determine your and the other's payoff from the round according to the same payoff table as in Part I.
- From the 60 rounds of the decision task in Part III, the computer will randomly select six rounds. The sum of Points you earned in these six rounds will be your earnings from Part III. Again, Points will be converted into Euros at an exchange rate of 100 Points = 1 Euro.

You can consult the detailed instructions of Part I anytime on the decision screen. But recall that Part IV of the experiment consists, unlike Part I, of 60 rounds. The sum of Points you earned in six randomly selected rounds will be your earnings from this part.

Start the next part!

C Additional tasks and questions

C.1 Elicitation of risk preferences

- Employ the procedure used in Goeree, Holt and Palfrey (2003), using lotteries with payoffs coming from the game subjects play in the experiment.
- To paraphrase the relevant passage in Goeree, Holt and Palfrey (2003) applied to our game:
- “Subjects make ten choices between lotteries A and B , which are constructed from the payoffs of the game used in the experiment. Lottery A paid 300 cents with probability p and 0 cents with probability $1 - p$, where p varied from 0.1, 0.2, ..., 1.0 in the 10 different choice problems. Similarly, lottery T yielded 0 cents with probability p and 200 cents with probability $1 - p$.”

For the purpose of our experiment this would mean that we could use the following table to elicit risk preferences:

	Option A	Option B
☐	10% chance to win 300 and 90% chance to win 0	10% chance to win 0 and 90% chance to win 200
☐	20% chance to win 300 and 80% chance to win 0	20% chance to win 0 and 80% chance to win 200
☐	30% chance to win 300 and 70% chance to win 0	30% chance to win 0 and 70% chance to win 200
☐	40% chance to win 300 and 60% chance to win 0	40% chance to win 0 and 60% chance to win 200
☐	50% chance to win 300 and 50% chance to win 0	50% chance to win 0 and 50% chance to win 200
☐	60% chance to win 300 and 40% chance to win 0	60% chance to win 0 and 40% chance to win 200
☐	70% chance to win 300 and 30% chance to win 0	70% chance to win 0 and 30% chance to win 200
☐	80% chance to win 300 and 20% chance to win 0	80% chance to win 0 and 20% chance to win 200
☐	90% chance to win 300 and 10% chance to win 0	90% chance to win 0 and 10% chance to win 200
☐	100% chance to win 300 and 0% chance to win 0	100% chance to win 0 and 0% chance to win 200

- One of the lines will be randomly selected for being played out and paid.

C.2 Strategic certainty

For answering the following question correctly, you will earn an additional 50 points.

In this task you will NOT be matched with another human participant but with a computer.

Consider the following payoff table:

		Computer's choice	
		A	B
Your choice	A	380	0
	B	0	200

The payoff table shows YOUR payoffs for each for each of the possible outcomes of your interaction with the computer. The computer receives no payoffs. **The computer is programmed to choose A with 40% chance and B with 60% chance.**

Given the chances with which the computer will choose A and B, which of the following answers is correct?

- ☐ A leads to a strictly higher expected payoff **for me** than B.
- ☐ B leads to a strictly higher expected payoff **for me** than A.
- ☐ A and B lead to the same expected payoff **for me**.

Next

For answering the following question correctly, you will earn an additional 50 points.

In this task you will NOT be matched with another human participant but with a computer.

Consider the following payoff table:

		Computer's choice	
		A	B
Your choice	A	300	0
	B	0	200

The payoff table shows YOUR payoffs for each for each of the possible outcomes of your interaction with the compute. The computer receives no payoffs. **The computer is programmed to choose A with a 20% chance and B with a 80% chance.**

Given the chances with which the computer will choose A and B, which of the following answers is correct?

- ☐ A leads to a strictly higher expected payoff **for me** than B.
- ☐ B leads to a strictly higher expected payoff **for me** than A.
- ☐ A and B lead to the same expected payoff **for me**.
